Database Management Systems

Dr. Aziz Kubilay Ovacıklı

In this Project I used the data from Pokémon Fire and Red game. In our queries we can see the all the gym master and their Pokémon also we can see all the item in the world and who use them, and you can see NPC and where they are work. It is a simple world simulation.

Biggest problem of mine in this project I was expecting to create a condition between Pokémon to show which one overcome the other Pokémon it was huge disappointment that I couldn't do it. Second biggest problem was defining name it getting confusing the rename the data and fixing all the attributes.
